PORTFOLIO INFORMATION

Scope, Attribution And Demonstration Media

Independent Project

Ginja is an independent project by Ry Dos. Third-party product names identify the corresponding products. No manufacturer affiliation, endorsement or certification is claimed.

Portfolio Availability

The public repository is a documentation and demonstration showcase. Application source and executable downloads are not publicly offered.

Demonstration Media

Recorded/example values, tutorial fixtures and screen composites illustrate workflows. Animated meters/connections do not establish a verified live session. Planned integrations remain labeled Upcoming.

Rights Remain Separate

Third-party materials retain applicable rights. Attribution does not replace required permission or license compliance.

DATA HANDLING

Local Monitoring And Optional Connections

Local Data

Preferences, routing rules, event history and session reports are stored locally in the reviewed implementation. Logs can contain device/app names, paths and errors. Review them before sharing.

External Connections

OBS uses the configured WebSocket endpoint. MIDI rules send to selected ports. Optional ping contacts the chosen host. Hardware links open configured apps or websites.

Discord Choices

Profile connection and public Rich Presence sharing are separate settings. Saved/migrated choices can restore defaults. Discord RPC can return identity and retrieve a public avatar from its CDN.

Product Boundary

The reviewed code does not expose Discord Online/Invisible status or notification feeds. No Ginja account backend or analytics service was identified in the reviewed modules. Verify any future build before extending those statements.

Before Posting Evidence

Redact passwords, tokens, private profiles and unnecessary personal information from reports and screenshots.
